

Life Armor Audiogram – Case Study

Conducted at Beltone Hearing Aid Center

Principle Investigators:

Beltone Hearing Aid Center
18546 Beach Blvd
Huntington Beach, CA 92648

Objective:

Purpose of this preliminary study was to compare the effects of Life Armor enhanced eye glasses on measures of auditory acuity.

Methods:

Standard Audiogram testing within frequency range of 150Hz to 9000Hz on a single male subject, age 75, with diminished auditory capabilities in the left ear.

Life Armor DNA NRG Technology (Life Armor)

Life Armor technology contains *bio-identical encoded electromagnetic patterns matching human DNA in an optimum state*. Derived from music formulas (science of Cymatics) the therapeutic qualities of vibratory tones and resonance support human function. Life Armor technology benefits the body by infusing it with these therapeutic qualities via photonic transmission. Life Armor-transmitted photons entrain with the body to re-establish and enhance the body's biofield¹ (NIH) coherency and introduce the optimized DNA electromagnetic patterns throughout the biofield. The enhanced biofield cascades its coherency into the anatomy, beneficially affecting the physiology of the body. In this study, Life Armor enhanced resin applied to subjects eye-glasses were worn during test period.

Results:

- Comparing control and Life Armor application, statistically significant differences of 4% in right ear speech test results.
- No statistically significant improvements were noted in the left ear.

Conclusion:

Based on observations of this study, administration of Life Armor technology led to a 4% increase in speech test results increases. Furthermore the test subject noted improved hearing at low Db speech levels after wearing Life Armor infused resin-coated glasses for a period of one week. This preliminary test shows statistically significant results over a short test period and warrants further study.
